

Activa Srl is "Champion of Growth"!!!

The result was published on November 1st 2021 in a special issue of La Repubblica "Affari & Finanza" and online on La Repubblica's website.

February 3rd 2022 Corigliano-Rossano (CS).

The German institute ITQF and La Repubblica A&F presented the study on the Italian companies with the greatest economic growth and ACTIVA S.r.l. was included in the prestigious ranking of the 600 Italian companies (the only one in Southern Italy in the chemical sector) with the greatest growth in turnover over the three-year period 2017-2020 (in 83rd place, the only one in Southern Italy in the chemical sector).

ACTIVA S.r.l. is a world leader in the production of "green" asphalt additives. Since 2017, the company has been using innovative and proprietary technologies to produce additives that improve the performance and durability of road pavements, lower the energy consumption and reduce greenhouse gas emissions into the atmosphere, making the road industry sector "sustainable". ACTIVA's commitment on the continuous innovation of its products is the fundamental premise for strengthening its competitiveness; the synergy between "research" and "process engineering" enables the production of ecological, biodegradable, non-hazardous and highly performant additives.

In 2021, ACTIVA confirmed its rising trend, recording a further 50% increase in turnover compared to 2020. As stated by engineer Francesco Paolo Santella, ACTIVA's manager:

"Our constant company growth is the consequence of the ongoing work of scientific research, technological innovation, motivation and organisation of human resources and, above all, it is the definition of precise objectives to be achieved in the short, medium and long term".

In order to deal with the constant growth of the company, ACTIVA has invested about 1 million euros in laboratory instruments and new equipment for the production site in Corigliano-Rossano (CS). The investments concerned the expansion of the raw materials storage capacity, with four new tanks (total capacity 200 cubic metres) that will be added to the 15 tanks already in service, and the doubling of daily production capacity, with the installation of two new chemical reactors, which will be added to the two already in service. The two new reactors (with a productivity of 10 tons/day) use "Industry 4.0" technology, so they are fully automated and interconnected with all the company's sectors: production, laboratory, logistics, administration.
